

NAEOS

Engineering Control Plane for AI-Native Software Delivery

Investor Deck • Formal Version

Specification	NEIR	Governance	Evidence
---------------	------	------------	----------

Problem

AI coding tools are accelerating generation, but most teams still lack a disciplined engineering layer for validation, governance, and auditability.

Opportunity

NAEOS provides the control plane needed to make AI-assisted engineering trustworthy, repeatable, and enterprise-ready.

The Market Problem

The bottleneck has shifted from code generation to engineering trust and control.

Architecture drift AI-generated code can create structural inconsistency when process, policy, and review are not tightly coupled to execution.	Policy fragmentation Governance remains inconsistent across teams, often disconnected from the actual software delivery workflow.
Limited traceability Teams struggle to connect specification, implementation, verification, artifacts, and downstream decisions.	Enterprise requirement Production adoption requires a system that is auditable, governable, and operationally consistent at scale.

Why This Matters Now

AI is moving from experimentation to production, and the next wave of value will come from engineering infrastructure.

Production adoption

Organizations increasingly need deterministic validation and safer AI workflows in real engineering environments.

Governance demand

Enterprise buyers require policy-aware execution, evidence capture, and audit readiness.

Open-source leverage

Publicly verifiable code and reproducible workflows build trust and ecosystem momentum.

Emerging category

NAEOS is positioned at the intersection of AI tooling, developer infrastructure, and software governance.

What NAEOS Is

NAEOS is not another coding assistant. It is the control plane that disciplines AI-native engineering operations.

Why NAEOS Is Different

The platform is designed around technical rigor, not raw generation output.

Specification as source of truth

NEIR provides a portable, verifiable system model that can be reused across tools and workflows.

Deterministic governance

Policy checks and validation are embedded into the pipeline rather than added as an afterthought.

Traceable delivery

Artifacts, metadata, and evidence can be linked back to the originating specification and run context.

Open-source foundation

The project is already executable in public, enabling trust-building, contributor feedback, and ecosystem validation.

Repository Proof

The current repository already contains significant evidence of technical product maturity.

Core directories

- cmd/naeos — CLI workflows for run, validate, context, verify, policy, and runtime
- pkg/pipeline — central execution pipeline for specification-to-output flows
- internal/neir — NEIR modeling, resolution, and validation
- internal/governance/policy — policy evaluation and enforcement
- internal/context/bundle — AI context generation from the engineering model
- internal/evidence — tamper-evident evidence storage and verification

Primary evidence

- WHITEPAPER.md
- site/content/investor-deck.md
- site/content/launch-announcement.md

Commercial Model

A credible open-core strategy preserves ecosystem value while monetizing the control-plane layer.

Governance layer Centralized policy management, approvals, and command control for teams.	Audit layer Evidence, compliance workflows, and traceable operational review.	Managed services Hosted deployments, enterprise integrations, and operational support.
---	---	--

Roadmap

The next p

Q1

Expand integration coverage and end-to-end examples

Q2

Deepen governance, observability, and audit capabilities

Q3

Validate with design partners and production-aligned teams

Q4

Refine managed and enterprise offerings on top of the open core

Investment Thesis

NAEOS sits at the intersection of three high-conviction trends: AI-native delivery, developer infrastructure, and open-source software adoption.

Why investors should pay attention

The strongest argument is not that NAEOS is another AI tool. It is that NAEOS is building the infrastructure layer required for AI-assisted engineering to become trustworthy, repeatable, and enterprise-ready.

The ask

Support product maturity, design-partner validation, ecosystem growth, and refinement of the commercial control-plane layer.

Closing

NAEOS already has a real technical foundation and a clear product thesis.

Opportunity

The opportunity is to turn that foundation into a durable engineering platform, a credible open-source ecosystem, and a high-value control-plane business for the AI-native software era.
